

A COMPLETE DEFENCE SOLUTION FOR ALL YOUR ONLINE SYSTEMS. PUTTING YOUR PROTECTION IN PLACE

Three defence systems, one complete offering

From communicating with clients and colleagues, to storing data and files; email, networks and the Internet are essential tools for any business. Yet while many firms have some online protection, most have experienced a security incident.

Can your company afford to count the cost of lost business, cash flow and creditability?

Vialtus Solutions Defender Suite blends three leading security products - MailDefender, WebDefender and DeskDefender - ensuring your business can work online in confidence. security incident.

Online dangers can arise in many areas. Perhaps your company will receive a virus by email that erases critical data and files. Maybe a network worm will find its way into the company's systems, destroying your servers. Or you might simply suffer from unproductive staff misusing the Internet.

Whatever the threat, one thing is clear: Failing to manage Internet traffic will leave your company facing inevitable risks and problems. That's where Defender Suite comes in; protecting your company's email, network and online browsing, securing your systems and allowing staff to work safely.

Defender Suite is a managed service. Which means it integrates effortlessly with your existing systems without creating more work for IT staff. While the solution is busy defending your company, you can focus on other essential tasks, safe in the knowledge you are secure.

MAILDEFENDER

Your first line of defence

In most companies, email is the most important application for communicating and collaborating. Unfortunately, it is also the most vulnerable system for allowing online threats into your business.

Included in the Defender Suite, MailDefender, is a complete email security solution for your business.

WEBDEFENDER

Defence from online dangers

The Internet is an essential business tool, offering staff a wealth of resources and services. But with viruses spreading increasingly online, the Internet presents huge risks to your business.

WebDefender filters all suspect content before it ever reaches your systems, ensuring you enjoy complete protection from the threats listed above. As an automatic managed service with no hardware or software to install, it allows you to manage security, set staff Internet access and view performance reports through a straightforward administration screen.

DESKDEFENDER

Defence at the heart of your network

Online threats are evolving. Everyday, new risks threaten your business. Completing the Defender Suite of solutions, DeskDefender is a robust security service offering round-the-clock protection for desktops and laptops.

The service blends Anti-Spyware detection, desktop firewall, intrusion prevention and detection, and application controls in one fully managed package.

MAILDEFENDER

Internet level operation

MailDefender is a fully automatic managed service, it operates at Internet level, scanning all mail in the network before delivering it to your inboxes. Even better, connecting to MailDefender couldn't be simpler. With no hardware or software to install, there's nothing to configure or maintain. In fact, MailDefender can be operational in a matter of hours.

Virus and junk mail protection

With spam volumes growing daily, many companies waste valuable Internet power, time and resources downloading and deleting junk mail. However, because MailDefender scans email from a central area, viruses and junk mail get nowhere near your mail server. The service operates automatically and updates its virus protection every five minutes.

Easy control and management

MailDefender allows you to regain control of your mail systems and reclaim wasted resources quickly and easily. Thanks to its personalised administration screen, using MailDefender is effortlessly straightforward, allowing staff with little or no IT knowledge to manage quarantined emails and spam definitions.

WEBDEFENDER

Malicious code

To avoid Anti-Virus email solutions, hackers are increasingly using web pages to transmit viruses, trojans, spyware and network worms. Visiting infected pages can seriously disrupt your business and disable your servers for days.

Browser vulnerabilities

Active code and scripts on web pages can conceal hacker threats that break through browsers and damage your systems. For example, they may access hard drives, unleash a virus or install spyware on your computers.

Inappropriate content

Studies show that many employees spend hours surfing sites and downloading material, damaging productivity and slowing Internet access. Even worse, staff downloading illegal content can leave your business facing serious legal risks.

DESKDEFENDER

Automatic service

DeskDefender automatically scans each system, detecting and removing threats and vulnerabilities. It also ensures your remote workers always have up-to-date security settings and virus definitions on their desktops and laptops.

Threat detection

When spyware and trojan software infect systems, it sends personal data to the Internet. DeskDefender's real-time scanning engine detects and prevents this from happening, while monitoring for unauthorised changes to your applications. The integrated firewall also deters attacks from such threats as network worms.

Effortless monitoring

Designed for effortless use, DeskDefender's online portal allows one member of staff to monitor the status of all computers, wherever they are situated. The service regularly emails reports to your administrator, who can allocate one of DeskDefender's pre-defined security profiles to each computer.

Defender Suite

WHAT'S IN IT FOR YOU?

- **Robust protection** Defender Suite combines three leading security services – MailDefender, WebDefender and DeskDefender – ensuring you're always defended from the latest threats.
- **Saves time and money** As a fully managed service, Defender Suite takes care of your online security, so you are free to take care of other tasks.
- **Powerful and effective** The service works behind the scenes on your systems, causing no delay to your online work.
- **Effortless management** Featuring easy-to-use administration screens, Defender Suite allows staff with little or no IT experience to manage your security.
- **No downtime** Defender Suite takes just minutes to set up and protect your business, requiring no new installations, infrastructure or software.
- **Grows with your business** As Defender Suite requires no new systems, it adapts easily to your company's changing size and needs.

TOGETHER AS ONE

Today's businesses face growing complex security risks, particularly from combined threats. Repelling these risks requires a Unified Threat Management solution, that brings security features together and defends users on the Internet, network and desktop. Defender Suite blends the advanced security features of three services into one robust offering, including firewalls, Anti-Virus, Anti-Spam and intrusion detection.
